

King Technology, Inc.

As our business has grown, we realized that the way we were managing our production scheduling, with manual spreadsheets and a reliance on subjective knowledge, was not efficient, productive or business smart. We decided to implement Master Scheduling/Material Requirements Planning. While we are very happy with the MS / MRP package, the addition of the Visual Planner package has really leveraged the benefits of MRP and maximized our productivity.

It is a significant part of our new production planning process. It has given us the ability to easily schedule products and move production around if we need to rearrange based on demand. It also allows us to see exactly where each of our production facilities is on the production schedule, including individual lines. It has sped up the planning process, eliminated our manual schedules and given us much-improved visibility of the overall production schedule. This has been a great product for us and an excellent investment that maximizes the productivity of our MS / MRP system.
